The invention comprises the amino acid and coding sequence of human secreted proteins. The DNA and protein sequences of the invention are useful in the treatment of cardiovascular disorders, such as: arrhythmia, atherosclerosis, stroke, endocarditis, congestive heart failure, rheumatic heart disease, cardiomyopathy, hemorrhoids, varicose veins, migraine, or thrombosis. The DNA and protein sequences may also be used for treating or preventing: neural disorders, immune system disorders, muscular disorders, reproductive disorders, jamune system disorders, pulmonary disorders, reproductive disorders, gastrointestinal disorders, cancercous diseases. The present DNA sequence is used in the exemplification of the invention. NOTE: The present sequence is shown on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Length 288;

The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids and proteins are useful in the diagnosis, treatment and prevention of conditions are useful in the dispussibly treatment and prevention of conditions polymeuropathy, atherosclerosis, anamaia, stroke, gangrene, impotence, infection, cataract, renal disorders, or endocrine disorders. The invention relates to novel genes and their fragments which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids and proteins are useful in the diagnosis, treatment and prevention of conditions related to diabetes, e.g. hyperglycaemia, obesity, retinopathy, polyneuropathy, atherosclerosis, anaemia, stroke, gangrene, impotence, infection, cataract, renal disorders, or endocrine disorders. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A human secreted protein and nucleic acids useful for preparing a diagnostic or pharmaceutical composition for diagnosing or treating diabetes or conditions related to diabetes, e.g. hyperglycemia, obesity,

Human:

Human secreted protein encoding genomic DNA SEQ ID NO 1646.

```
The invention relates to novel human genes (ABZ66891-ABZ68209) and the encoded secreted proteins (ABP99470-ABP99872) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and in the specification. The nucleic acids, proteins, antibodies and in the specification. The nucleic acids, proteins, antibodies and antibacists are useful in the disgnosis, treatment and prevention of:

(a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung or urogenital; (b) immune disorders e.g. Addison's disease,

(c) lung or urogenital; (b) immune disorders e.g. Addison's disease,

(c) alergies, autoimmune haemolytic ansemia, autoimmune thyroiditis,

diabetes mellitus, Crohn's disease, multiple sclerosis, rhemmatoid

arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial anoxia and epilepsy; and (f) infectious diseases such as viral,

```
The invention relates to novel human genes (ABZ66891-ABZ68209) and the encoded secreted proteins (ABP99470-ABP99872) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthur tris, and ulcerative collitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        92

```
The invention relates to novel human genes (ABZ66891-ABZ68209) and the encoded secreted proteins (ABP99470-ABP99872) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the disapmosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung or urogenital; (b) immune disorders e.g. Addison's disease, altergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, carbritis and ulcerative collitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anazia and epilepsy; and (f) infectious diseases such as viral,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

Note: Organ: pancreas; Vector: pSPORTI (GIBCO); Site_1:
Not I; Site_2: Sal I; The library was prepared by
Catherine S. Lee and has not been published. The pancreas
was obtained from Gerard Gradwohl (PNAS 97 P1607-1611,
2000). The cDNA's were prepared with an oligo containing a
NotI site, and SalI linkers were added to the ends. The
inserts were cut with NotI before being cloned into the
NotI-SalI sites in the vectors. This is one of two
libraries, ngn3 wt and ngn3 -/-. The wt library is in
pSPORTI, T7 promoter is 5'."

Polynucleotide(s) and proteins derived from Staphylococcus aureus -stored on computer readable medium and used in the production of anti-S.aureus vaccines.

Claim 1; Page 2287; 3271pp; English.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable endedium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or

```
ö
industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against 8. aureus infection. The polypeptides can also be used in a kit for the immunodetection of S. aureus in a sample. S. aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, acalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating homologues of any of the S. aureus DNA sequences contained on the computer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AGGGTTATTGTCTCATGAGCGGATACATATTTGAATGTATTTAGAAAATAAACAAATAG

ö
translational start signal. In the examples, the 3' end of pKT241 was attached to the signal DNA sequence of the DNA fragment (19) for rat preproinsulin (see AAN10013). The closest identifiable promoter for the penicillinase gene in pKT218 (AAN10032) is located in the region 14 to 20 mucleotides before its translational start signal. In the examples, the 3' end of pKT218 was attached to the signal DNA sequence of the DNA fragment (CB6) for rat preproinsulin (see AAN10034)
                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The closest identifiable promoter for the penicilinase gene in pKT241 (AAN10031) is located in the region 14 to 20 nucleotides before its translational start signal. In the examples, the 3' end of pKT241 was attached to the signal DNA sequence of the DNA fragment (19) for rat preproinsulin (see AAN10033). The closest identifiable promoter for the penicillinase gene in pKT218 (AAN10032) is located in the region 14 to 2 nucleotides before its translational start signal. In the examples, the

PAIs are large fragments of DNA which comprise pathogenicity determinants. The sequences of the invention are taken from PAI IV and PAI IV is located at approximately 64 min (near phev) approximately 94 min (at phex) on the E. coli chromosome and is greater than IV of kb. PAI V is located at approximately 94 min (at phex) on the E. coli chromosome and is approximately 160 kb in size. Antibodies specific to the proteins encoded

                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence encodes beta-urogastrone under the control of a tac promoter. The peptide may be expressed from plasmid pUGT 150s in a transformed E.coli host. The plasmid may carry several separately expressing sequences comprising a tac promoter, SD site, signal peptide, and coding sequence, to produce beta-UG in high yield. (Updated on 10-MAR-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)

```
An example of a sequence detected by a probe consisting of polyinosine, polydeoxyinosine, oligoinosine and/or oligodeoxyinosine is labeled. The sens and probe are hybridized and the existence of DNA in the product is detected. It can be used to detect the presence of malignant tumour. (Updated on 10-MAR-2003 to add missing OS field.) The present invention relates to Drosophila cell cycle progression proteins (AAM47572-AAM47608) and their coding sequences (ABA90366-ABA90520). The coding sequences and proteins are useful for identifying substance capable of affecting the function of the corresponding gene, a substance capable of inhibiting the cell division cycle, or capable of inhibiting the cell division cycle, or capable of inhibiting a tumour or proliferative disorder, cardiovascular disorders (such as restenosis and cardiomyopathy), autoimmune disorders such as (glomerulonephritis and rheumatoid arthritis), dermatological disorders (such as psoriasis), antiinflammatory, antifungal and antiparasitic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 AGGGTTATTGTCTCATGAGCGGATACATATTTGAATGTATTTAGAAAAATAAACAAATAG
                                                                                                                                                                                                                                                                    Polynucleotides encoding cell cycle progression proteins, useful for treating a tumor or a proliferative disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Treponema pallidum infection; syphilis; Borrelia infection; animal; enzyme production; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polynucleotide sequence from the genome of Treponema pallidum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 466 BP; 135 A; 87 C; 93 G; 150 T; 0 U; 1 Other;

The deriv. has the same biological or pharmacological activities as betaurogastrone. It is not susceptible to denaturation by oxidn. and is chemically stable. Deriv. has resistance to proteolytic enzymes such as protease. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New beta-urogastrone deriv. - has gastric acid secretion inhibition and proliferation promotion activity.
                Sequence of HB101 (pGH201) encoding new beta-urogastrone deriv. Met(21)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to Drosophila cell cycle progression proteins (AAM47572-AAM47608) and their coding sequences (ABA90366-ABA90520). The coding sequences and proteins are useful for identifying a substance capable of affecting the function of the corresponding gene, a substance capable of inhibiting the cell division cycle, or capable of inhibiting a tumour or proliferative disorder, cardiovascular disorders (such as restenosis and cardiomyopathy), autoimmune disorders such as ciglomerulonephritis and rheumatorid arthritis), dermatological disorders (such as psoriasis), antiinflammatory, antifungal and antiparasitic

This invention relates to a novel method for the optimisation of primer libraries. Specifically, it refers to increasing the affinity of short oligonucleocide primers, also known as extendable oligos (EOs), for their template sequences. The present invention describes improved methods for sequencing and the linear and exponential amplification of DNA that can amplification, strand displacement amplification of DNA that can amplification. Accordingly, these extendable oligos with improved specificity and affinity are particularly important in fields ranging from biotechnology and agriculture to medical research. This polynucleotide sequence is the electropherogram of a DNA sequencing reaction that used the pUCL9 plasmid and B154/T422 oligos, used in an exemplification of the invention.
                                                                                                                                                                                                                                                                            ds; primer library; extendable oligos; EO; ligation chain reaction; LCR; xolling circle amplification; strand displacement amplification; isothermal DNA amplification; biotechnology; agriculture; medical research; pUCI9 plasmid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Increasing the affinity of an extendable oligonucleotide (EO) for a target nucleic acid, for providing primers having improved specificity, comprises hybridization of the EO to a template oligonucleotide (TO) and
                                                                                                                                                                                                                                           Electropherogram of a DNA sequencing reaction using E154 & T422.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 605 BP; 159 A; 133 C; 147 G; 148 T; 0 U; 18 Other;

The invention relates to novel isolated prostate gland related nucleic acids (I) and polypeptides (II). (I) and (II) are useful for diagnosis, prognosis, prognosis, procedution, and/or treatment of diseases and/or disorders of the prostate such as acute non-bacterial prostatitis, chronic non-bacterial prostatitis, prostatodystonia, prostatous prostatuous prostatitis, malacoplakia, benign prostatic non-bacterial prostatitis, prostatodystonia, prostatous, granulomatuus prostatitis, malacoplakia, benign prostatic chromas, including adenocarcinomas, transitional cell carcinomas, ductal carcinomas, including adenocarcinomas, transitional cell carcinomas, ductal carcinomas, and squamous cell carcinomas. (I), (II) and antibody to (II) are useful for diagnosing and treating reproductive system disorders (Paget si disease), attritis), blood-related disorders (sickle cell anaemia), hyperproliferative disorders (sickle cell anaemia), hyperproliferative disorders (sickle cell anaemia), respiratory disorders (musculomephritis), cardiovascular disorders (arrhythmias), respiratory disorders musculoskeletal system disorders (arrhythmias), respiratory disorders (Addison's disease and Parkinson's disease), endocrine disorders (Addison's disease and Parkinson's disease), condocrine disorders (Addison's disease and Parkinson's disease), condocrine disorders, liver disorders (biliary liver cirrhosis), condomined and shorders (biliary liver cirrhosis), condomined and inherited disorders (diseases at the cellular level, and wound healing and epithelial cell proliferation. (I) or (II) and organs before transplantation, and as food additive or preservative.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                546 AGGGTTATTGTCTCATGAGGGGGATACATATTTGAATGTATTTAGAAAAAATAACAAAATAG 487

```
The invention relates to novel isolated polypeptides (I), and diagnostice (II). (I), (II) and the antibody to (I) are useful for diagnosticy, preventing and treating diseases including immune system disorders (e.g. congenital and acquired immunodeficiencies, autoimmune disorders (e.g. congenital and acquired immunodeficiencies, autoimmune confusing, properties (e.g. repeating disorders, haemoglobin abnormalities and cother blood-related disorders (e.g. hepatitis C), bleeding disorders, haemoglobin abnormalities and other blood-related disorders (e.g. hepatitis C), bleeding disorders, haemoglobin abnormalities and cother blood-related disorders (e.g. disorders, primary haematopoietic disorders, hyperproliferative disorders (e.g. Alzheimer's disease, Parkinson's disease), chromosomal abnormalities (e.g. Alzheimer's disease, Parkinson's (e.g. stroke), renal disorders (e.g. arrythmia), respiratory disorders, dermatological disorders (e.g. Addison's epithelial cell proliferation, endocrine disorders (e.g. Addison's epithelial cell proliferation, endocrine disorders (cirrhosis), as stimulators of disease), reproductive system disorders (cirrhosis), as stimulators of theses, higher affinity antibodies, and as a means to induce tumour proliferation in pathologies e.g. acquired immune deficiency syndrome (AIDS). AAS26976-AAS27850 represent novel signal transduction pathway protein coding sequences and PCR primers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel polypeptides useful for diagnosing, treating, preventing and/or prognosing disorders related to the proteins, including cancers, immune disorders and neuronal disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 101; DB 4; Length 776; 100.0%; Pred. /clone="top-color: PWD42nv; Purified macronuclear chromosomal
/note="Vector: PWD42nv; Purified macronuclear chromosomal
DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
oligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWD42 (gil4732114|gp|AF125072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. Coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

/note="Vector: PWD42nv; Purified macronuclear chromosomal
DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
oligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWD42 (gil4732114|gb|AR129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. Coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

/note="Vector: PWDAJON; Purified macronuclear chromosomal DNA from Oxytricha trifallax was blunt end-repaired with T4 DNA polymerase and T4 polymolecited kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. Vector DNA was prepared from a derivative of pWDA2 (gil 4732114 | gb | AF125072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. Coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

// Clone lib="Worytricha plasmid UNGC10 library"
// Clone lib="Morytricha plasmid UNGC10 library"
// Clone lib="Worytricha trifallax was blunt end-repaired with DNA from Oxytricha trifallax was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. Vector DNA was prepared from a derivative of pWM42 (gi|473114|qb|AF129072.1), a copy-number inducible derivative of plasmid R1 The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. Coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

/note="Vector: PWD42nv; Purified macronuclear chromosomal
DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
oligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWD42 (gi|4732114|gb|AR129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. Coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

/clone lib="Corytricha plasmid UUGCIO library"
/note="Vector: PWD42nv; Purified macronuclear chromosomal
DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide Kinase. Adaptor
oligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. Coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Original source text: Rous sarcoma virus (Schmidt-Ruppin strain, subgroup D) provirus, cDNA to 21S mRNA from infected chicken embryonic fibroblasts, clone pSR1.

[1] sites; mRNA start.
Original figure in [2] included 24 'g's on 5' end and 16 'c's on 3' end that were cDNA synthesis artifacts.

[2] also sequenced a defective clone, pSR2, with the src gene deleted (see separate entry).

[1] demonstrated the mRNA transcription initiation site shown in the Sites table using pSR1 as a template. However, this is the 3' LTR, and the functional mRNA start site would be assumed to be on the 5' LTR at the homologous site.

Location/Qualifiers
